ONE

## **PREFACE**

#### **Chinese proverb**

The palest ink is better than the best memory. – old Chinese proverb

## 1.1 About

#### 1.1.1 About this tutorial

This document is a summary of my valueable experiences in using Python for Data Scientist daily work. The PDF version can be downloaded from HERE. You may download and distribute it. Please be aware, however, that the note contains typos as well as inaccurate or incorrect description.

In this repository, I try to use the detailed Data Scientist related demo code and examples to share some useful python tips for Data Scientist work. If you find your work wasn't cited in this note, please feel free to let me know.

Although I am by no means a python programming and Data Scientist expert, I decided that it would be useful for me to share what I learned about Python in the form of easy tutorials with detailed example. I hope those tutorials will be a valuable tool for your studies.

The tutorials assume that the reader has a preliminary knowledge of python programing, LaTex and Linux. And this document is generated automatically by using sphinx.

#### 1.1.2 About the authors

#### Wengiang Feng

- Data Scientist and PhD in Mathematics
- University of Tennessee, Knoxville

- Webpage: http://web.utk.edu/~wfeng1

- Email: von198@gmail.com

#### • Biography

Wenqiang Feng is Data Scientist within DST's Applied Analytics Group. Dr. Feng's responsibilities include providing DST clients with access to cutting-edge skills and technologies, including Big Data analytic solutions, advanced analytic and data enhancement techniques and modeling.

Dr. Feng has deep analytic expertise in data mining, analytic systems, machine learning algorithms, business intelligence, and applying Big Data tools to strategically solve industry problems in a cross-functional business. Before joining DST, Dr. Feng was an IMA Data Science Fellow at The Institute for Mathematics and its Applications (IMA) at the University of Minnesota. While there, he helped startup companies make marketing decisions based on deep predictive analytics.

Dr. Feng graduated from University of Tennessee, Knoxville, with Ph.D. in Computational Mathematics and Master's degree in Statistics. He also holds Master's degree in Computational Mathematics from Missouri University of Science and Technology (MST) and Master's degree in Applied Mathematics from the University of Science and Technology of China (USTC).

#### Declaration

The work of Wenqiang Feng was supported by the IMA, while working at IMA. However, any opinion, finding, and conclusions or recommendations expressed in this material are those of the author and do not necessarily reflect the views of the IMA, UTK and DST.

## 1.2 Motivation for this tutorial

No matter you like it or not, Python has been one of the most popular programming languages. I have been using Python for almost 4 years. Frankly speaking, I wasn't impressed and attracted by Python at the first using. After starting working in industry, I have to use Python. Graduately I recognize the elegance of Python and use it as one of my main programming language. But I foud that:

- Most of the Python books or tutorials which emphasize on programming will overwhelme the green hand.
- While most of the Python books or tutorials for Data Scientist or Data Analysis didn't cover some essential skills from the engineer side.

So I want to keep some of my valuable tips which are heavily applied in my daily work.

# 1.3 Feedback and suggestions

Your comments and suggestions are highly appreciated. I am more than happy to receive corrections, suggestions or feedbacks through email (Wenqiang Feng: von198@gmail.com) for improvements.

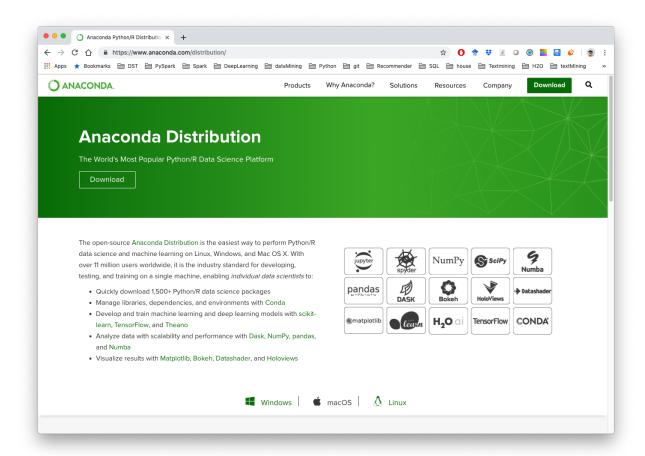

# **TWO**

# **PYTHON INSTALLATION**

**Note:** This Chapter *Python Installation* is for beginner. If you have some Python programming experience, you may skip this chapter.

No matter what operator system is, I will strongly recommend you to install Anaconda which contains Python, Jupyter, spyder, Numpy, Scipy, Numba, pandas, DASK, Bokeh, HoloViews, Datashader, matplotlib, scikit-learn, H2O.ai, TensorFlow, CONDA and more.

Download link: https://www.anaconda.com/distribution/

THREE

## **NOTEBOOKS**

**Note:** This Chapter *Notebooks* is for beginner. If you have alreay know Nteract, Zeppelin and Python, you may skip this chapter.

If you are a Data Scientist, it's not enough to just know Jupyter Notebook. You should also take a look at nbviewer, Nteract and Zeppelin notebooks.

## 3.1 Nteract

Nteract is an amazing .ipynb reader. You can open and run the .ipynb by just double clicking the .ipynb file.

Download from: https://nteract.io/

# 3.2 Jupyter Notebook Viewer

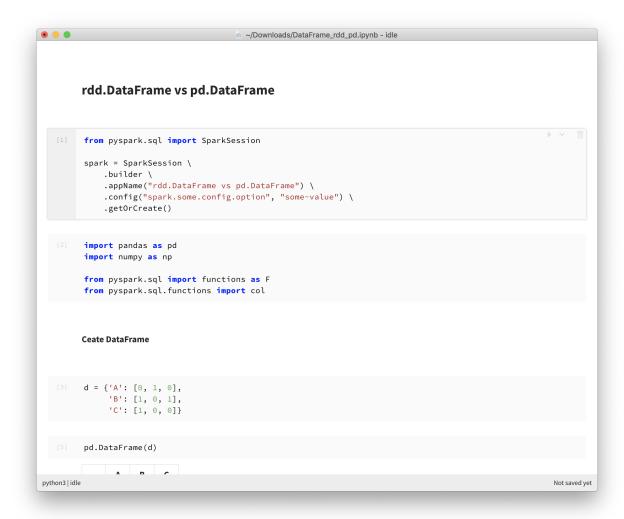

If you are a MAC user, you can also install the Jupyter Notebook Viewer—nbviewer—app which is much faster than Nteract.

Download from: https://github.com/tuxu/nbviewer-app

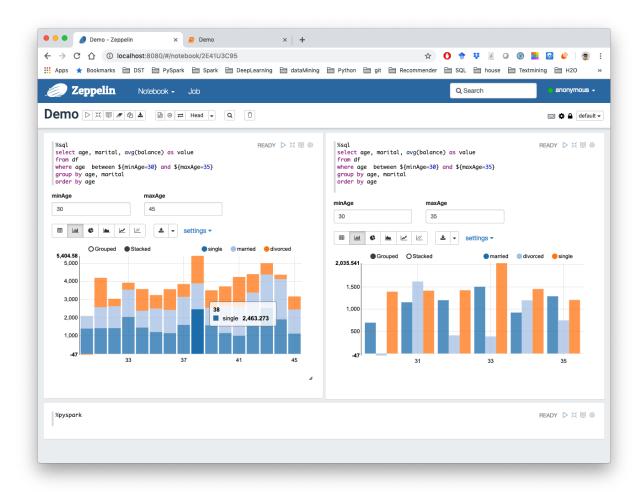

# 3.3 Apache Zeppelin

The Zeppelin (Apache Zeppelin) is an open-source Web-based notebook that enables datadriven, interactive data analytics and collaborative documents with Python, PySpark, SQL, Scala and more.

Download from: https://zeppelin.apache.org/

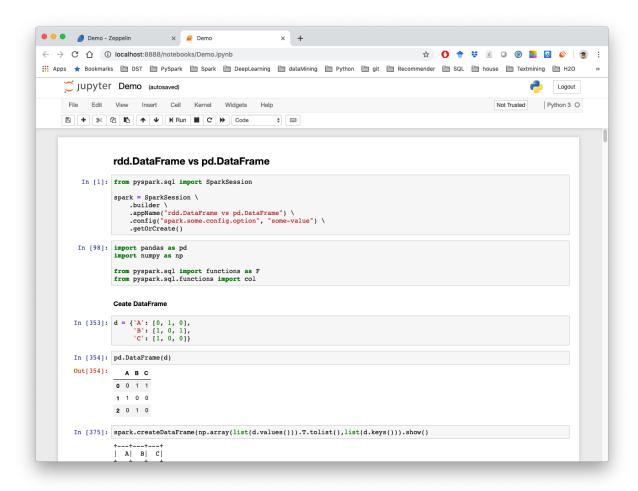

```
DataFrame_rdd_pd.ipynb
            rdd.DataFrame vs pd.DataFrame
    In [1]: from pyspark.sql import SparkSession
             spark = SparkSession \
                 .builder \
                 .appName("rdd.DataFrame vs pd.DataFrame") \
.config("spark.some.config.option", "some-value") \
                 .getOrCreate()
  In [98]: import pandas as pd
             import numpy as np
            from pyspark.sql import functions as F from pyspark.sql.functions import col
            Ceate DataFrame
  In [354]: pd.DataFrame(d)
Out [354]: A B C
            0 0 1 1
            1 1 0 0
             2 0 1 0
```

# 3.4 Jupyter Notebook

The Jupyter Notebook (Ipython Notebook) is an open-source web application that allows you to create and share documents that contain live code, equations, visualizations and narrative text. Uses include: data cleaning and transformation, numerical simulation, statistical modeling, data visualization, machine learning, and much more.

**FOUR** 

## CONFIDENTIAL INFORMATION

#### **Chinese proverb**

Be mindful of guarding against harm from others, and stay away from placing harming upon others.

If you are a real Data Scientist, you have to share your code with your colleagues or release your code for Code Review or Quality assurance(QA). You will definitely do not want to have your User Information in the code. So you can save them in login.txt in a safe folder:

```
runawayhorse001
PythonTips
```

and use the following code to import your User Information:

```
#User Information
try:
    login = pd.read_csv(r'login.txt', header=None)
    user = login[0][0]
    pw = login[0][1]
    print('User information is ready!')
except:
    print('Login information is not available!!!')
```

You may also want to get the User Information by using os.environ in Python:

```
try:
    user = os.environ['LOGNAME']
except OSError:
    user = os.environ['USER']
except OSError:
    user = os.environ['USERNAME']
    print(err)
except OSError as err:
    print('The user information is not available!!!')
```

**FIVE** 

## PRIMER FUNCTIONS

**Note:** This Chapter *Primer Functions* is for beginner. If you have some Python programming experience, you may skip this chapter.

The following functions have been heavily used in my daily Data Scientist work.

## 5.1 \*

Single asterisk as used in function declaration allows variable number of arguments passed from calling environment. Inside the function it behaves as a tuple.

:: Python Code:

```
my_list = [1,2,3]
print(my_list)
print(*my_list)
```

:: Ouput:

```
[1, 2, 3]
1 2 3
```

# 5.2 range

:: Python Code:

```
print(range(5))
print(*range(5))
print(*range(3,8))
```

#### :: Ouput:

```
range(0, 5)
0 1 2 3 4
3 4 5 6 7
```

# 5.3 random

More details can be found at:

- a. random: https://docs.python.org/3/library/random.html#random.randint
- b. np.random: https://docs.scipy.org/doc/numpy/reference/routines.random.html

#### 5.3.1 random.random

:: Python Code:

```
import random
random.random()

# (b - a) * random() + a
random.uniform(3,8)
```

:: Ouput:

```
0.33844051243073625
7.772024014335885
```

## 5.3.2 np.random

:: Python Code:

```
np.random.random_sample()
np.random.random_sample(4)
np.random.random_sample([2,4])

# (b - a) * random_sample() + a
a = 3; b = 8
(b-a) *np.random.random_sample([2,4])+a
```

:: Ouput:

```
0.11919402208670005

array([0.07384755, 0.9005251 , 0.30030561, 0.38221819])

array([[0.76851156, 0.56973309, 0.47074505, 0.7814957 ],

[0.5778028 , 0.94653057, 0.51193493, 0.48693931]])

array([[4.65799262, 6.32702018, 6.55545234, 5.45877784],

[7.69941994, 4.68709357, 5.49790728, 4.60913966]])
```

### 5.4 round

Sometimes, we really do not need the scientific decimals for output results. So you can use this function to round an array to the given number of decimals.

:: Python Code:

```
np.round(np.random_random_sample([2,4]),2)
```

:: Ouput:

```
array([[0.76, 0.06, 0.41, 0.4], [0.07, 0.51, 0.84, 0.76]])
```

# 5.5 TODO...

:: Python Code:

```
:: Python Code:

:: Ouput:

:: Python Code:

:: Ouput:
```

5.4. round 19

::	Ouput:
::	Python Code:
::	Ouput:

Python Tips for Data Scientist, Release 1.00

SIX

# **DATA STRUCTURES**

**Note:** This Chapter *Data Structures* is for beginner. If you have some Python programming experience, you may skip this chapter.

## **6.1 List**

List is one of data sctructures which is heavily using in my daily work.

#### 6.1.1 Create list

1. Create empty list

The empty list is used to initialize a list.

:: Python Code:

```
my_list = []
type(my_list)
```

:: Ouput:

```
list
```

I applied the empty list to initialize my silhouette score list when I try to find the optimal number of the clusters.

:: Example:

```
min_cluster = 3
max_cluster =8
```

(continues on next page)

(continued from previous page)

```
# silhouette_score
scores = []

for i in range(min_cluster, max_cluster):
    score = np.round(np.random.random_sample(),2)
    scores.append(score)

print(scores)
```

#### :: Ouput:

```
[0.16, 0.2, 0.3, 0.87, 0.59]
```

# 6.1.2 Unpack list

## 6.1.3 Methods of list objects

Methods of list objects:

Name	Description
list. append(x)	Add an item to the end of the list
list. extend(iterable)	Extend the list by appending all
list. insert(i, x)	Insert an item at a given position
list. remove(x)	Remove the first item
list. pop([i])	Remove the item at given position
list. clear()	Remove all items from the list
list. index(x[,s[,e]])	Return zero-based index in the list
list. count (x)	Return the number of times x
list. sort (key, reverse)	Sort the items of the list
list. reverse()	Reverse the elements of the list
list. copy ()	Return a shallow copy <sup>1</sup> of list

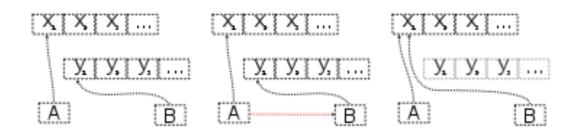

# 6.2 Tuple

A tuple is an assortment of data, separated by commas, which makes it similar to the Python list, but a tuple is fundamentally different in that a tuple is "immutable." This means that it cannot be changed, modified, or manipulated.

<sup>&</sup>lt;sup>1</sup> Shallow Copy vs Deep Copy Reference: https://stackoverflow.com/posts/184780/revisions Shallow copy:

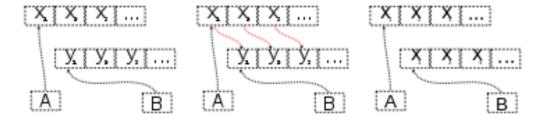

# 6.3 Dictionary

[VanderPlas2016] [McKinney2013] [Georg2018]

The variables A and B refer to different areas of memory, when B is assigned to A the two variables refer to the same area of memory. Later modifications to the contents of either are instantly reflected in the contents of other, as they share contents.

Deep Copy:

The variables A and B refer to different areas of memory, when B is assigned to A the values in the memory area which A points to are copied into the memory area to which B points. Later modifications to the contents of either remain unique to A or B; the contents are not shared.

6.3. Dictionary

## DATA READ AND INGESTION WITH DATABASE

# 7.1 Data Ingestion from Local to DataBase

```
# User Information
try:
   login = pd.read_csv(r'login.txt', header=None)
   user = login[0][0]
   pw = login[0][1]
   print('User information is ready!')
except:
   print('Login information is not available!!!')
# Database information
host = '##.###.##'
db_name = 'db_name'
table_name = 'table_name'
# Setup connection
conn = psycopg2.connect(host=host, database=db_name, user=user,_
→password=pw)
cur = conn.cursor()
# Creat table in DataBase
conn.commit()
query = """
   DROP TABLE IF EXISTS {table name};
   CREATE TABLE {table_name}
    ( id character varying(20)
      , val1 double precision
      , val2 double precision
      , val3 double precision
      , val4 text
   DISTRIBUTED BY (id);
```

(continues on next page)

(continued from previous page)

```
GRANT SELECT ON TABLE {table_name} TO xxxx;
    """.format(table_name=table_name)
cur.execute(query)
conn.commit()
# load the data
df = pd.read_csv('xx.csv')
# Write dataframe to memory as csv
csv io = io.StringIO()
df.to_csv(csv_io, sep='\t', header=True, index=False)
# Copy the dataframe in memory to GP
conn.commit()
copy\_sql = """
           COPY {table_name} FROM stdin WITH CSV HEADER
           DELIMITER as '\t'
           """.format(table_name=table_name)
cur.copy_expert(sql=copy_sql, file=csv_io)
conn.commit()
```

**Note:** You can also use copy\_to to copy the dataframe from local memory to GP

```
cur.copy_to(df, table_name)
```

# 7.2 Data Read from DataBase to Local

```
# User information

try:
    login = pd.read_csv(r'login.txt', header=None)
    user = login[0][0]
    pw = login[0][1]
    print('User information is ready!')

except:
    print('Login information is not available!!!')

# Database information
host = '##.###.##'
db_name = 'db_name'
table_name = 'table_name'
```

(continues on next page)

(continued from previous page)

# **EIGHT**

# PD.DATAFRAME MANIPULATION

**Note:** This Chapter *Notebooks* is for beginner. If you have some Python programming experience, you may skip this chapter.

# 8.1 TODO...

## **CHAPTER**

# **NINE**

# RDD. DATAFRAME MANIPULATION

**Note:** This Chapter *Notebooks* is for beginner. If you have some Python programming experience, you may skip this chapter.

# 9.1 TODO...

**CHAPTER** 

**TEN** 

# PD.DATAFRAME VS PD.DATAFRAME

## 10.1 Create DataFrame

#### **10.1.1 From List**

```
my_list = [['a', 1, 2], ['b', 2, 3],['c', 3, 4]]
col_name = ['A', 'B', 'C']
```

:: Python Code:

```
# caution for the columns=
pd.DataFrame(my_list,columns= col_name)
#
spark.createDataFrame(my_list, col_name).show()
```

:: Comparison:

**Attention:** Pay attentation to the parameter columns= in pd.DataFrame. Since the default value will make the list as rows.

```
:: Python Code:
```

```
# caution for the columns=
pd.DataFrame(my_list, columns= col_name)
#
pd.DataFrame(my_list, col_name)
```

```
:: Comparison:

A B C 0 1 2
0 a 1 2 A a 1 2
1 b 2 3 B b 2 3
2 c 3 4 C c 3 4
```

#### **10.1.2 From Dict**

```
d = {'A': [0, 1, 0],

'B': [1, 0, 1],

'C': [1, 0, 0]}
```

#### :: Python Code:

#### :: Comparison:

# 10.2 Load DataFrame

#### 10.2.1 From DataBase

Most of time, you need to share your code with your colleagues or release your code for Code Review or Quality assurance(QA). You will definitely do not want to have your User Information in the code. So you can save them in login.txt:

```
runawayhorse001
PythonTips
```

and use the following code to import your User Information:

```
#User Information

try:
    login = pd.read_csv(r'login.txt', header=None)
    user = login[0][0]
    pw = login[0][1]
    print('User information is ready!')

except:
    print('Login information is not available!!!')

#Database information
host = '##.###.##"
db_name = 'db_name'
table_name = 'table_name'
```

**Attention:** Reading tables from Database with PySpark needs the proper drive for the corresponding Database. For example, the above demo needs org.postgresql.Driver and you need to download it and put it in jars folder of your spark installation path. I download postgresql-42.1.1.jar from the official website and put it in jars folder.

#### 10.2.2 From .csv

## **10.2.3 From** . json

Data from: http://api.luftdaten.info/static/v1/data.json

```
dp = pd.read_json("data/data.json")
ds = spark.read.json('data/data.json')
```

#### :: Python Code:

```
dp[['id','timestamp']].head(4)
#
ds[['id','timestamp']].show(4)
```

```

Python Tips for Data Scientist, Release 1.00									

**CHAPTER** 

# **ELEVEN**

# **PACKAGE WRAPPER**

It's super easy to wrap your own package in Python. I packed some functions which I frequently used in my daily work. You can download and install it from My PySpark Package. The hierarchical structure and the directory structure of this package are as follows.

## 11.1 Hierarchical Structure

```
PySparkTools/
   __init__.py
   - PySparkTools
      — ___init___.py
       - Manipulation
           DataManipulation.py
         ____init___.py
       - Visualization
          — <u>__</u>init__.py
           - PyPlots.py
          — PyPlots.pyc
   - README.md
   requirements.txt
    setup.py
    test
      — spark-warehouse
       - test1.py
      - test2.py
```

From the above hierarchical structure, you will find that you have to have \_\_init\_\_.py in each directory. I will explain the \_\_init\_\_.py file with the example below:

# 11.2 Set Up

```
from setuptools import setup, find_packages
try:
   with open("README.md") as f:
        long_description = f.read()
except IOError:
   long_description = ""
try:
    with open("requirements.txt") as f:
        requirements = [x.strip() for x in f.read().splitlines() if x.
→strip()]
except IOError:
    requirements = []
setup(name='PySParkTools',
          install_requires=requirements,
      version='1.0',
      description='Python Spark Tools',
      author='Wengiang Feng',
      author_email='von198@gmail.com',
      url='https://github.com/runawayhorse001/PySparkTools',
      packages=find_packages(),
      long_description=long_description
```

# 11.3 ReadMe

(continues on next page)

(continued from previous page)

```
cd PySparkTools
pip install -r requirements.txt
python setup.py install

- test

```{bash}
cd PySparkTools/test
python test1.py

```
```
